WHAT IS CLAIMED IS:

5

10

15

25

An aluminum-coated structural member comprising: a steel substrate layer; and

an Al-Si-Fe alloy layer formed on a surface of the steel substrate layer, the alloy layer including a softer region having a hardness smaller than or equal to a hardness of the steel substrate layer, extending from the surface of the steel substrate layer toward a surface of the alloy layer, and having a thickness greater than or equal to 50% of a thickness of the alloy layer, the Al-Si-Fe alloy layer having an oxide weight smaller than or equal to 500 mg/dm².

- 2. The aluminum-coated structural member as claimed in Claim 1, wherein the Al-Si-Fe alloy layer has a multi-layer structure including an inner layer contiguous with the steel substrate layer, and an outer layer forming the surface of the alloy layer.
- 3. The aluminum-coated structural member as claimed in Claim 2, wherein the inner layer is a softest layer in the multi-
 - 4. The aluminum-coated structural member as claimed in Claim 2, wherein the inner layer contains $85 \sim 95\%$ Fe, and the inner layer is softer in Hv hardness than an average hardness of the alloy layer by a percentage more than or equal to 20%.
 - 5. The aluminum-coated structural member as claimed in Claim 2, wherein the multi-layer structure of the Al-Si-Fe alloy layer further comprises an intermediate layer containing

25~40% Al, and the intermediate layer is lower in hardness than the steel substrate layer.

6. The aluminum-coated structural member as claimed in Claim 2, wherein the multi-layer structure of the AI-Si-Fe alloy layer further comprises a plurality of intermediate layers, at least one of the intermediate layers containing 25~40% AI, and being lower in hardness than the steel substrate layer.

5

- 7. The aluminum-coated structural member as claimed in Claim 2, wherein the outer layer of the Al-Si-Fe alloy layer is harder than the steel substrate layer.
- 8. The aluminum-coated structural member as claimed in Claim 2, wherein the outer layer contains 35~50% Fe.
 - An aluminum-coated structural member comprising:
 a steel substrate layer; and
- an Al-Si-Fe alloy layer formed on a surface of the steel substrate layer, the Al-Si-Fe alloy layer having a multi-layer structure including an inner layer contiguous with the steel substrate layer, an outer layer forming a surface of the alloy layer and an intermediate layer formed between the inner and outer layers, the inner layer containing 85~95% Fe, the intermediate layer containing 25~40% Al, and the outer layer being harder than the steel substrate layer.
 - 10. A production method of an aluminum-coated structural member comprising:
- heating a hot-dip aluminum-coated steel sheet at a heating rate in a range of 1~10°C/sec;

holding the hot-dip aluminum steel sheet at a raised temperature in a temperature range of $900\sim950^{\circ}\text{C}$ for a duration in a range of $2\sim8$ minutes;

5

cooling the hot-dip aluminum-coated steel sheet to a temperature in a temperature range of $700 \sim 800^{\circ}$ C at a cooling rate in a range of $5 \sim 15^{\circ}$ C/sec;

forming the hot-dip aluminum-coated steel sheet into a predetermined shape in the temperature range of $700 \sim 800^{\circ}\text{C}$; and

cooling the hot-dip aluminum-coated steel sheet in the predetermined shape rapidly from the temperature range of 700~800°C to a lower temperature lower than or equal to 300°C at a cooling rate in a range of 20~100°C/sec.
